AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application.

Listing of Claims:

1. (currently amended) A method for management of a dynamic range of a radiological image comprising:

acquiring an image of an object with a radiology apparatus having a detector and a source of radiation, the image thus acquired possessing a wide dynamic range of acquisition;

computing an image of radiological thicknesses of the image of the object crossed by the radiation from the acquired image;

filtering the image of the radiological thicknesses to obtain a context image;

subtracting the context image from the image of the radiological thicknesses to obtain an image of the details;

processing the context image by means of a first table computed from the image of the radiological thicknesses to obtain an image with a reduced dynamic range;

processing the context image by means of a second table computed from the image of the radiological thicknesses to obtain an image of coefficients which will then weight the image of the details to obtain an image of enhanced details; ~~[[and]]~~

adding together the image with reduced dynamic range and the image of the enhanced details to obtain an image with reduced dynamic range and heightened contrast in which the differences between structures of the object ~~anatomical structures~~ are preserved~~[[,]]~~; and

compressing the dynamic range of the image with reduced dynamic range and heightened contrast ~~is compressed~~ so that it is contained within the dynamic range of an imaging device with a small dynamic range, this small dynamic range of the imaging

Appl. No. 10/721,613
Docket No. 14XZ129307/GEM-0107

device being smaller than the wide dynamic range of the acquired image, thereby permitting an acquired image originally having a wide dynamic range to be displayed with heightened contrast on an imaging device having a smaller dynamic range.

2. (currently amended) The method according to claim 1 wherein:

to obtain the image of the enhanced details, the image of the details is weighted, pixel by pixel, by an image of coefficients, the values of the coefficients being a positive function of the values of the context image at the [[ir]] position of the signals of the context image.

3. (currently amended) The method according claim 1 wherein:

the context image is built from the image of the radiological thicknesses by a median filtering, ~~or by a statistical filtering of another type.~~

4. (currently amended) The method according claim 2 wherein:

the context image is built from the image of the radiological thicknesses by a median filtering, ~~or by a statistical filtering of another type.~~

5. (currently amended) The method according to claim 1 wherein:

[[the]] a function applied to each pixel of the context image to obtain the image with reduced dynamic range is positive, linear by pieces and non-decreasing and/or the coefficients which, in each pixel, multiply the detail image to obtain the image of the enhanced details are computed by applying a positive function, that is constant by pieces, to each pixel of the context image, the coefficients being smaller than 1 if the contrast at their position has to be reduced, equal to 1 if the contrast at their position has to be kept as it is and greater than 1 if the contrast at their position has to be heightened.

Appl. No. 10/721,613
Docket No. 14XZ129307/GEM-0107

6. (currently amended) The method according to claim 2 wherein:

[[the]] a function applied to each pixel of the context image to obtain the image with reduced dynamic range is positive, linear by pieces and non-decreasing and/or the coefficients which, in each pixel, multiply the detail image to obtain the image of the enhanced details are computed by applying a positive function, that is constant by pieces, to each pixel of the context image, the coefficients being smaller than 1 if the contrast at their position has to be reduced, equal to 1 if the contrast at their position has to be kept as it is and greater than 1 if the contrast at their position has to be heightened.

7. (currently amended) The method according to claim 3 wherein:

[[the]] a function applied to each pixel of the context image to obtain the image with reduced dynamic range is positive, linear by pieces and non-decreasing and/or the coefficients which, in each pixel, multiply the detail image to obtain the image of the enhanced details are computed by applying a positive function, that is constant by pieces, to each pixel of the context image, the coefficients being smaller than 1 if the contrast at their position has to be reduced, equal to 1 if the contrast at their position has to be kept as it is and greater than 1 if the contrast at their position has to be heightened.

8. (currently amended) The method according to claim 1 wherein:

the ~~compression~~ compressing of the dynamic range is obtained by a positive and non-decreasing function, characterized by two parameters adjustable by [[the]] a user, [[the]] a parameter that controls the maximum differential gain, and [[the]] a parameter which defines [[the]] a level of maximum differential gain level in [[the]] a basic starting dynamic range.

9. (currently amended) The method according to claim 2 wherein:

the ~~compression~~ compressing of the dynamic range is obtained by a positive and non-decreasing function, characterized by two parameters adjustable by [[the]] a user, [[the]] a parameter that controls the maximum differential gain, and [[the]] a parameter

Appl. No. 10/721,613
Docket No. 14XZ129307/GEM-0107

which defines ~~[[the]]~~ a level of maximum differential gain level in ~~[[the]]~~ a basic starting dynamic range.

10. (currently amended) The method according to claim 3 wherein:

the ~~compression~~ compressing of the dynamic range is obtained by a positive and non-decreasing function, characterized by two parameters adjustable by ~~[[the]]~~ a user, ~~[[the]]~~ a parameter that controls the maximum differential gain, and ~~[[the]]~~ a parameter which defines ~~[[the]]~~ a level of maximum differential gain level in ~~[[the]]~~ a basic starting dynamic range.

11. (currently amended) The method according to claim 4 wherein:

the ~~compression~~ compressing of the dynamic range is obtained by a positive and non-decreasing function, characterized by two parameters adjustable by ~~[[the]]~~ a user, ~~[[the]]~~ a parameter that controls the maximum differential gain, and ~~[[the]]~~ a parameter which defines ~~[[the]]~~ a level of maximum differential gain level in ~~[[the]]~~ a basic starting dynamic range.

12. (currently amended) The method according to claim 8 wherein:

the operations of processing the images of context and the images of the details are modified as a function of the value that controls the maximum differential gain selected by ~~[[the]]~~ a user.

13. (currently amended) The method according to claim 2 wherein:

the operations of processing the images of context and the images of the details are modified as a function of the value that controls the maximum differential gain selected by ~~[[the]]~~ a user.

Appl. No. 10/721,613
Docket No. 14XZ129307/GEM-0107

14. (currently amended) The method according to claim 3 wherein:
the operations of processing the images of context and the images of the details are modified as a function of the value that controls the maximum differential gain selected by [[the]] a user.

15. (currently amended) The method according to claim 4 wherein:
the operations of processing the images of context and the images of the details are modified as a function of the value that controls the maximum differential gain selected by [[the]] a user.

16. (currently amended) The method according to claim 1 wherein:
[[the]] computations of [[the]] two functions used to modify the images of context and of the details are predefined as functions of proportion of object structure, and are adapted by a calibration procedure to each radiological thickness image.

17. (currently amended) The method according to claim 2 wherein:
[[the]] computations of [[the]] two functions used to modify the images of context and of the details are predefined as functions of proportion of object structure, and are adapted by a calibration procedure to each radiological thickness image.

18. (currently amended) The method according to claim 3 wherein:
[[the]] computations of [[the]] two functions used to modify the images of context and of the details are predefined as functions of proportion of object structure, and are adapted by a calibration procedure to each radiological thickness image.

19. (currently amended) The method according to claim 4 wherein:
[[the]] computations of [[the]] two functions used to modify the images of context and of the details are predefined as functions of proportion of object structure, and are adapted by a calibration procedure to each radiological thickness image.

Appl. No. 10/721,613
Docket No. 14XZ129307/GEM-0107

20. (currently amended) The method according to claim 8 wherein:
[[the]] computations of [[the]] two functions used to modify the images of context and of the details are predefined as functions of proportion of object structure, and are adapted by a calibration procedure to each radiological thickness image.

21. (currently amended) The method according to claim 12 wherein:
[[the]] computations of [[the]] two functions used to modify the images of context and of the details are predefined as functions of proportion of object structure, and are adapted by a calibration procedure to each radiological thickness image.

22. (new) The method according to claim 1 further comprising:
determining a threshold based upon a histogram of the object in the image of the radiological thicknesses; and
defining regions of the object based upon the threshold.

23. (new) The method according to claim 22 further comprising:
based upon the defined regions of the object, computing coefficients which, in each pixel, multiply the detail image to obtain the image of enhanced details, by applying a positive function, that is constant by pieces, to each pixel of the context image.
